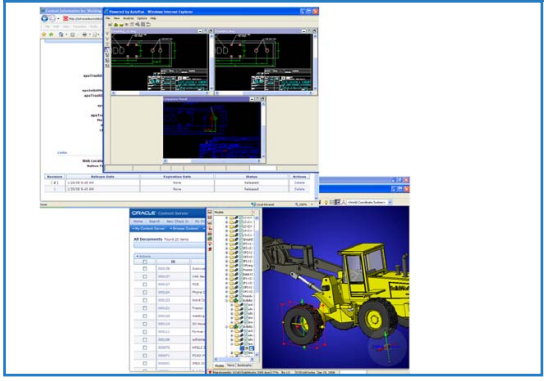
AutoVue Vuelink Integration for Oracle Universal Content Management

With Oracle's AutoVue VueLink Integration for Oracle Universal Content Management, organisations gain the most value from their digital documents. Combined with Oracle Universal Content Management, AutoVue enterprise visualisation products make technical data and product information available across the enterprise and empower teams at all phases of the product lifecycle to view, annotate, review, and collaborate on technical and nontechnical documents in a powerful, flexible, and secure manner.

BENEFITS & FEATURES

- Visualise CAD and engineering files within Oracle Universal Content Management
- Empower teams with access to both technical and non-technical documents
- Enhance and speed up review cycles
- Audit trail compliance
- Maintain document integrity and set a higher level of document security
- Extend workflows and team reviews
- Reduce costs related to the purchase of expensive authoring applications
- Web-based document viewing
- Hundreds of supported formats
- Real-time collaboration
- Document comparison
- Measurements
- Markups & annotations stored in the content management repository
- Manage X-REFS, assemblies, annotations with UCM Folios
- Burn in redactions to TIFF

FIGURE 01



View, review, markup and collaborate on hundreds of document types in their native format - all from directly within your Oracle Universal Content Management environment

Make technical information assets widely available
Provide both engineers and nontechnical users with easy access to hundreds of document types stored in the content management repository. These documents are available for viewing, printing, collaboration, annotation, and markup. Regardless of the users' technical skill level, all team members have immediate access to accurate technical product information—including 3-D parts and assemblies, 2-D computer-aided design (CAD) drawings and their associated external reference files, printed circuit board layouts and schematics, Office documents, and graphics. Information flows throughout the entire product lifecycle, allowing teams to make sound business decisions quickly, based on reliable data.

End costly and error-prone document conversions
Eliminates the need for time consuming and error-prone document conversions and translations by allowing the ability to open and view native documents without the authoring application, ensuring that teams are always working with the latest version of a file. Since file conversion is not required, AutoVue enterprise visualisation products also eliminate the tedious task of creating and managing a double set of data, such as the original document and the converted/neutral files. The cost and complexity of maintaining multiple client-side viewers and server-side conversion systems is also eliminated, delivering a simpler IT infrastructure for enterprise visualisation.

Expedite the Review Process

Adding the powerful mark-up and real-time collaboration capabilities of AutoVue enterprise visualisation products to Oracle Universal Content Management, organisations can automate and expedite review cycles. AutoVue's rich set of markup entities allows users to annotate documents digitally and effectively communicate feedback, change requests and instructions in context of the design. All markups and annotations are created as distinct overlays—on top of the original file—and stored directly into the Oracle Universal Content Management vault, providing users with a reliable audit trail of historical changes. Reviewers can then turn markup layers on and off as needed, selecting only those that they wish to view. Real time collaboration means teams interact immediately instead of spending expensive cycles emailing comments back and forth. (figure 1)

Set a higher level of document security

AutoVue enterprise visualisation products follows authentication and security models based on Oracle Universal Content Management and ensures the original document, with its proprietary data, is never transferred to the client machine. Users only have access to a rendering of a document for viewing and markup.
