Project Resource Management Makes Sense

Silverbucket offers a simple cloud service for project resource allocation management. Optimising project resources leads to increased profitability. Silverbucket gives clear visibility of organisation resources, drives project efficiency and delivers competitive advantage.

Corporate software does not have to be difficult to use. Silverbucket is a user-friendly solution that has been developed in conjunction with clients.

Increase transparency in resource allocation management

When resource data is stored in one place and is updated constantly, optimising resourcing plans on project, team and individual level is effortless. The information Silverbucket provides enhances transparency and openness within your organization.

Recognize resourcing problems

It is easier to fix problems when they are signalled as they occur. As you add or change resource allocations you can keep track of the overall people resource position. You are quickly able to recognize and fix potential problems such as under and overload situations and other resourcing conflicts.

Better forecasting

When plans change, project allocation figures in Silverbucket update immediately. You can instantly see the impact of your resourcing actions. The views and reports in Silverbucket make resource forecasting simple.

Useful information to support decision making and leadership

Silverbucket's excellent data filtering options and report features add efficiency to resource and project financial management. In Silverbucket, it is easy to get information for managing both single projects and project portfolios. The information provided supports management level strategic decision making.

A tool favoured by many

We know that adding and changing resource allocations on a regular base requires a tool that is easy to use. This is why user friendliness forms the basis of our development process. Because resourcing in Silverbucket is simple, users are motivated to keep data up to date. Our very responsive technical support will assist whenever needed.

__) R

Resourcing aids productivity

With Silverbucket you are able to boost your organization's human resource utilization rate. Resourcing becomes clearer and the amount of free time for relevant project work increases.

Already 100 customers trust Silverbucket in project resource management Silverbucket is used in over 40 countries around the world

50-10 000

Ideal for project resource management between 50 and 10 000 people

The perfect overview of project resourcing

he main resourcing graph provides a versatile view of the actual resourcing situation in your organisation. Different user groups are able to examine resourcing data from chosen viewpoints and time ranges while understanding the overall situation throughout the organisation. Recognizing under and overload situations as well as different role requirements brings much needed information to your project planning. You can edit resource allocations in different time modes (month, week, day) and allocation scales (percentages, hours, workdays).

Effortless and fast resource allocating

Allocating a person to a project or making allocation changes should not be a time-consuming operation. In Silverbucket, adding project members is simple and allocations are made with a single mouse gesture. Forecasts are updated instantly and you can immediately see how changes effect a project's financials. Forecasts, key figures and utilization rates can be followed in real time. One key feature is the option to allocate role needs to projects, when the need for a project member is identified, but the individual is yet to be identified.

Be in control of project portfolios

Silverbucket allows you to define a project's budget, priority and risk levels (resourcing scope, budget risks and schedule). In addition to single project level monitoring you can follow projects' progress from a portfolio viewpoint: you can add projects to portfolios or categorize them using tags. You can also filter and follow project data on customer and organization levels.

Filter resource data and create reports to support decision making

Do you require better facts about utilization rates, teams' and other user group's overall resourcing situations or reports to support your decisions? Silverbucket provides excellent data filters and reporting features, which provide support for resource and project finance management. Different parties, such as project managers, team leaders and the management level are offered information on resourcing and how it affects projects' success. Current data enables fast overviews in real time and the ability to react straight away when resourcing situations require your attention.

Hour tracking

The Silverbucket-resourcing solution has an hour tracking feature that supports project resourcing. Hours are added in a simple interface, where each person can add their work hours to projects in day or week views. This allows forecasting remaining work and comparison of realised hours to plans.

What can be integrated?

We often hear the question "Can you integrate our people and projects from our existing backend system to Silverbucket?". In most cases, you can fully manage your company's resourcing process with a standalone Silverbucket service. Naturally, in some environments there already is a backend system containing project and people information, frequently including the actual hours and projects' financial history.

Integrating Silverbucket with an existing backend system can give additional benefits. Information need only be entered once, to a single service. From then on, you make the future project planning in Silverbucket.

The most common information imported includes:

- Projects and customers
- People
- Actual hours
- Project invoices and expenses.

Once imported, all future project planning is performed in Silverbucket.

We have implemented many integrations, both into and out of Silverbucket. Whilst integrations are not always necessary, Silverbucket works well alongside other systems. For example, Silverbucket is used in conjunction with Jira, ValueFrame, PARM, Maconomy, Visma Severa and PlanMill.
